

product/technical team synch

Meeting date: June 29, 2026, 04:00 pm

General Summary

- **Product Development:** Advancing realmspace demo to version two MVP this month for real-world testing and customer demos.
- **Demo Capabilities:** Current demo detects and tracks people but lacks full data processing for actionable insights.
- **Data Collection:** Tracks anonymous visitors passively; collects personal data only with active user consent and interaction.
- **Lead Attribution:** Relies on booth incentives and supports multiple input channels for capturing visitor contact info.
- **Automation:** Plans for real-time lead triggers, CRM integrations, and alert systems like Slack and SMS during events.
- **Website & Branding:** New Floats site prototype launching by Wednesday; logo uses tech-inspired design with neon colors.
- **Team Workflow:** Breaking down tasks for weekly deliveries; new AI/cloud engineer joins mid-month; focus on end-to-end flow validation.

Notes

Product Development and MVP Progress

- The team is focused on advancing the realmspace demo from an initial version to a more robust **version two MVP** within the month to enable real-world testing and customer engagement (02:50).
- **MVP roadmap and technical approach** centers on building a stable prototype through AI-assisted coding, leveraging existing system architecture to accelerate development and iterative shipping (03:09).
- The current MVP serves only as a storytelling tool, with the goal to make it a reliable product ready for demos and limited deployment.
- The team expects to keep refining the system continuously until it reaches a reliable, production-ready state.
- This approach prioritizes speed and adaptability, balancing early functionality with ongoing improvement.

- **Current demo capabilities** include basic person detection from camera feeds and simple tracking, but the system lacks full data processing and attribution necessary for real deployments (12:54).
 - The existing tool functions primarily as a skeleton or prototype, collecting data but not yet integrating it into actionable insights.
 - The plan is to build out a complete end-to-end pipeline for data ingestion, session tracking, real-time operations, and reporting.
- **Testing methodology** currently uses pre-recorded videos from sources like YouTube to simulate event environments for tuning tracking algorithms (16:02).
 - The team debates the importance of real-time analytics versus post-event analysis, weighing client needs and technical feasibility.
 - AWS EC2 servers are considered for cloud processing, while local-first solutions are also discussed to handle connectivity and latency issues.
- **Version two MVP success criteria** include demonstrating a full event flow with data collection, session management, real-time tracking, and lead attribution working end to end (28:36).
 - The system must function under real-world conditions including network instability and hardware issues.
 - Documentation and resilience testing with both live and mock data are planned as part of this milestone.

Data Collection, Attribution, and Client Needs

- The team clarified that the system captures both **anonymous and personally identifiable data** to balance privacy and marketing needs (43:00).
- **Dual data streams** track all visitors anonymously while collecting identifiable information only when users interact actively and consent, such as by entering emails or phone numbers (44:31).
 - Passive data includes movement and engagement metrics without personal IDs.
 - Active data collection occurs through touchscreen apps, games, questionnaires, or QR code scans at the booth.
- **Lead capture and attribution** depend heavily on booth operator strategies to incentivize visitors to share contact info (41:36).
 - The system supports multiple interaction channels including QR codes to facilitate easy input of personal data.
 - Creative incentives are recommended to increase participation, such as gamification or rewards.

- **System design implications** require standardizing data schemas to correlate interaction events, session timing, zones, and personal data into a unified event bus (27:09).
 - This enables robust attribution and triggers for CRM integration and automated follow-ups.
- **Client priorities for data delivery** focus on real-time lead identification and attribution to support immediate marketing actions during events (19:30).
 - Other metrics such as foot traffic and engagement can be processed and reported after the event.
 - The platform must be seamless and easy for clients to deploy without technical overhead.

Integration and Automation Strategy

- The discussion outlined plans for **automating lead management and alert systems** to close the loop between data collection and client CRM platforms (30:00).
- **Attribution triggers** will activate actions based on visitor behavior, such as dwelling time or zone presence, assuming personal identity is known (31:00).
 - These triggers run on live event streams and connect directly to marketing systems.
- **CRM integration** options include Apollo and Clearbit APIs, with potential for HubSpot and others to push leads automatically (31:59).
 - This integration aims to feed visitor data directly into client sales pipelines.
- **Real-time alerts** such as Slack, email, or SMS notifications are identified as a priority feature to keep stakeholders informed during activations (33:45).
 - Alerts help remote stakeholders stay updated without relying on onsite personnel.
- **Future automation** may extend to multi-event follow-ups and cross-event analytics but will be addressed in later development phases (32:50).

Website Rebranding and Marketing Alignment

- The team is working on a **rebranded Floats company website** to better showcase realmspace and related products, targeting a launch by **Wednesday** to support upcoming event pitches (05:45).
- **Current status** is a Cloudflare-hosted prototype site featuring 3D renders of the sensing kit hardware and product use cases (05:00).
 - The kit uses generic CCTV and LiDAR sensors presently, with plans for custom manufacturing later.
 - Use cases presented include brand activations, trade shows, retail, and sponsorship engagements.

- **Feedback process** is underway with Dimitris tasked to review the site urgently and provide feedback by end of day or Wednesday (06:40).
- The goal is to finalize the website so prospective clients see a modern, clear product offering.
- **SEO and content strategy** will be integrated into this site as part of establishing the Floats brand umbrella (05:25).
- The site will serve as the primary marketing landing page linking to realmspace demos and other offerings.

Branding and Design Direction

- Miracle presented a **logo and branding concept** focused on a geometric, tech-inspired monogram representing "R" and "S" for realmspace (53:15).
- **Logo design** is symmetrical and modular, scalable from small icons to large displays while still recognizable (55:14).
 - The design evokes cubes and data flow, reinforcing the tech and spatial intelligence themes.
 - Variations include word marks and icon-only versions with a focus on clean, modern aesthetics.
- **Typography and color palette** choices include neon orange, cyan, and magenta in lighter shades to create a glowing effect (57:45).
 - Fonts considered include Inter for body text and monospace terminal style fonts for tech feel.
 - Color usage aligns with product features like heatmaps and data visualizations.
- **Branding assets** such as icons and logo variants will be delivered for website and app use, supporting consistent visual identity (59:05).
- Miracle will share detailed branding documents and assets post-meeting for team review (01:00:09).

Team Roles, Workflow, and Collaboration

- The team agreed on **breaking down development into manageable tasks** to ensure progress on key features within weekly cycles ahead of the mid-month engineer onboarding (38:20).
- **Current team capacity** includes one engineer joining around the 15th, skilled in AI-forward and cloud coding (38:40).
 - Until then, floats XR will continue coding core features based on clear task definitions.
 - Dimitris and Miracle will focus on hardware integration, algorithms, and system hosting.
- **Task management strategy** aims for small daily or weekly deliverables allowing parallel workstreams for coding, documentation, and research (38:24).

- **Dimitris emphasized his strength in data pipelines and trigger-based workflows**, offering to take lead on that area aligned with his professional experience (48:31).
 - He will support converting raw data into CRM-ready triggers and reports.
- **The team aligned on a flexible approach** prioritizing functional flows over perfection for the month-end milestone (51:11).
 - The focus is validating end-to-end process flows even if the system is rough or incomplete.
- **Meeting recordings and summaries** will be shared to ensure clarity and enable asynchronous review (48:23).

Action items

Dimitris Asimakopoulos

- Review the Floats website draft and provide feedback urgently to meet the Wednesday launch deadline supporting upcoming pitches (06:41)
- Assist with designing the data pipeline, specifically converting raw data into database entries and implementing triggers for notifications such as emails and alerts (48:31)
- Review the meeting video and transcription after distribution to ensure completeness and clarify any points if needed (48:01)

floats XR

- Share the recorded meeting video and transcript with the entire team for reference and follow-up (48:23)
- Finalize updates to the Floats website and deploy the new version by Wednesday to align with pitch event schedules (05:54)
- Document the database schema and data ingestion pipeline to support data collection and resilience testing for the MVP phase (28:36)
- Define mini task lists and weekly sprint goals for the development team to maintain progress until the new AI-adept engineer joins on the 15th (38:24)
- Continue development of the RealmSpace MVP focusing on validating session flow, trigger functionality, and attribution features aiming for end-of-month delivery (51:11)

Miracle Otugo

- Evaluate cloud hosting options such as AWS EC2 and assess local-first resilience strategies for processing video and sensor data to ensure robustness and ease of setup (17:56)
- Share branding documents including logos, color palettes, and typography proposals after the meeting for team review and feedback (01:00:09)
